| 1 | Nano-cubosomes of the phyto-active principle in Withania somnifera: LC-MS-NMR, anti-microbial, and insights of the anti-neuropathic and anti-inflammatory mechanism | Microbiology | Withania somnifera (W. somnifera) has a long history of safety in the amelioration of neuro-active ailments. The current study aims to explore Withania somnifera phyto-active principle anti-microbial, ant-neuropathic, and anti-inflammatory activities, and to modify these activities utilizing nano-cubosomes exploiting their mechanisms of action. Bio-guided fractionation technique was utilized, to identify the most phyto-active compound, using LC-MS-NMR online technique and biological models of diabetes, neuropathy, and | 2024                           | <a href="https://www.sciencedirect.com/science/article/pii/S0367326X24003794">https://www.sciencedirect.com/science/article/pii/S0367326X24003794</a> |

|---|---|--------------|---|------|---|
|   |   |              | inflammation. In-vitro antibacterial activity was also monitored. The HbA1c, in-vivo antioxidant (serum-catalase, TBARS, and GSH), serum insulin, and pro-inflammatory serum cytokines (TNF alpha, IL-six, and IL-ten) levels have been assessed to establish the anti-neuropathic and anti-inflammatory mechanisms. The nanocubosomal formulations (CUB 1–3) were utilized to improve the W. somnifera |      |   |
| 2 | Antibacterial and antibiofilm activities of diclofenac against levofloxacin-resistant <i>Stenotrophomonas maltophilia</i> isolates; emphasizing repurposing of diclofenac | Microbiology | Materials and Methods: Minimum inhibitory concentration was determined using broth microdilution method for levofloxacin, diclofenac, and levofloxacin/diclofenac combination. Biofilm forming capacity and biofilm inhibition assay were determined.   | 2024 | <a href="https://www.ncbi.nlm.nih.gov/pmc/articles/PMC11162161/">https://www.ncbi.nlm.nih.gov/pmc/articles/PMC11162161/</a> |

Relative gene expression was measured for efflux pump genes; smeB, and smeF genes and biofilm related genes rmlA, spgM, and rpfF without and with diclofenac and the combination.

Results:

Diclofenac demonstrated MIC of 1 mg/ml. The combination-with ½ MIC diclofenac-showed synergism where levofloxacin MIC undergone 16–32 fold decrease. All the isolates that overexpressed smeB and smeF showed a significant decrease in gene expression in presence of diclofenac or the combination. The mean percentage inhibition of biofilm formation with diclofenac and the combination was 40.59% and 46.49%, respectively. This agreed

| 3 | Evaluation of Azithromycin and Fenugreek Oil as Anti-virulence Agents against Stenotrophomonas maltophilia MultiDrug Resistant Clinical Isolates | Microbiology | <p>Stenotrophomonas maltophilia is a gram-negative opportunistic pathogenic bacterium that is associated with hospital- and community-acquired infections. It has a set of virulence factors, such as biofilm formation and extracellular enzymes, that are mostly regulated via quorum sensing (QS) systems. Azithromycin (AZM) is a macrolide that is well known for its anti-virulence effects, including anti-QS and antibiofilm effects. Additionally, some spice essential oils have been reported to inhibit bacterial virulence. This study evaluated the effect of AZM and Fenugreek Oil (FO), a spice essential oil from Fenugreek seeds, against</p> | 2024 | <a href="https://ejbo.journals.ekb.eg/article_325699.html">https://ejbo.journals.ekb.eg/article_325699.html</a> |

some virulence factors of multidrug-resistant *Stenotrophomonas maltophilia* clinical isolates. Both AZM and FO showed significant inhibitory effects against protease activity, where all tested isolates showed 100% loss of the halo zone formed in skimmed milk agar test with AZM and a 25 to 35% reduction in the zone with FO. A mean reduction in the interstitial surface area of 34.4% and 35.5% was detected with AZM and FO, respectively, in the twitching motility assay. While AZM showed a significant effect in reducing biofilm formation by *S. maltophilia* isolates (mean inhibition of 49.7%), the reducing effect of FO (18.5%) was not significant. Genotypically, exposure

|---|--|--------------|---|------|---|
|   |  |              | of <i>S. maltophilia</i> clinical isolates to AZM and FO significantly reduced the expression of protease-encoding genes (stmPr1, stmPr2 and StmPr3) and a quorum sensing gene (rpfC).  |      |   |
| 4 | Potential antiviral activity of metformin against human Adenovirus-7 | Microbiology | <p>Background<br/>Human adenovirus 7(HAdV-7) cause acute respiratory tract infections with high morbidity and mortality rates in children and immunocompromised adults. Metformin is a natural oral antihyperglycemic drug, that possesses antiviral activity. Our study aimed to investigate and compare the antiviral activity and mechanism of action of metformin and ribavirin against HAdV-7.</p> <p>Methods<br/>The antiviral activity and cytotoxicity of each of metformin and ribavirin</p> | 2024 | <a href="https://journals.ekb.eg/article_339378.html">https://journals.ekb.eg/article_339378.html</a> |

per se and in combination were tested using the crystal violet method. The mechanism of action of metformin against HAdV-7 was assessed during viral adsorption and replication phases. The viricidal effect and cytopathic effect inhibition of metformin was also determined. Results Metformin revealed a moderate antiviral activity against HAdV-7 with a selective index = estimated CC50/estimated IC50 = 5.0 in comparison with selective index of ribavirin 1.82. Metformin demonstrated modest antiviral activity against HAdV-7 with a selective index = estimated CC50/estimated IC50 = 5.62 during the replication process, but

|   |   |              | <p>not during the other phases of infection. The combined effect of both drugs revealed a low antiviral activity against HAdV-7 in comparison to using each drug alone; Antiviral index = 2.87, SI = 5.0.</p> <p>Conclusion<br/>Metformin has a potential promising antiviral activity against HAdV-7.</p>   |      |  |
| 5 | <p>Evaluation of Wound Healing Parameters and Antibacterial Effect of Jojoba and Citrullus colocynthis Oils in Staphylococcus Wound Infection Induced in Mice</p> | Microbiology | <p>Staphylococcus aureus is responsible for most bacterial wound infections. Antibiotics are the first-line treatment; however, their indiscriminate use led to the emergence of resistance. Alternative therapeutic options beyond antibiotic treatment are required. Our study aimed to evaluate and compare the healing parameters and antibacterial activity of Jojoba and Citrullus</p> | 2023 | <p><a href="https://pdfs.semanticscholar.org/1c2d/0ec5f768f925079dd16858e7a096a1e04e5e.pdf">https://pdfs.semanticscholar.org/1c2d/0ec5f768f925079dd16858e7a096a1e04e5e.pdf</a></p> |

colocynthis oil extracts in the treatment of Staphylococcus aureus wound infections. In-vivo assessment of inflammatory biomarkers, matrix metalloproteinase and histopathological examination of Staphylococcus aureus induced wound lesions were conducted in mice. Levels of interleukin 1 and interleukin 6 were reduced, while matrix metalloproteinases ratio; MMP-1/MMP-9 was increased after topical application of both essential oils. Citrullus colocynthis oil showed optimum wound healing compared to the other treated groups in histopathological examination. In conclusion, topical Citrullus colocynthis preparation may be a

| 6 | Interspecies Interaction between Pseudomonas aeruginosa, Staphylococcus aureus and E. coli in vitro. | Microbiology | Microbial interactions are frequently categorized according to how they affect each population in a binary system. We aimed to determine the interaction between P. aeruginosa, S. aureus, and E. coli in-vitro. In this experimental hospitalized patients' sputum, urine, and blood samples were used to collect a total of 90 clinical isolates for the study in Damanhour Medical National Institute, Behira, Egypt, followed by accurate identification and testing for antibiotic sensitivity. To examine the effect of the supernatant of P. aeruginosa on S. aureus and E. coli determined MIC using broth microdilution method. We also measured the activity of lasA protease by assessing the S. aureus cell lysis potential of P. aeruginosa culture supernatants. Extraction of pyocyanin was made to determine the change in the cell nature of S. aureus upon exposure to pyocyanin by | 2023 | <a href="https://dl.wqixs1.xdc7.cloudfront.net/105180256/626654brc.pdf?1692636739--&amp;response-content-disposition=inline%3B+filename%3DInterspecies_Interaction_between_Pseudom.pdf&amp;Expires=1725965680&amp;Signature=MAD0AZ1i42Cg-SA9YKg5XhEu0EgTAP1OAMzguOeA1UAe9e2Y-GBvdNJS0SHGiiPLjFMHVpN0eiSZRkgrj3-K2ZadpvfPNDy-iGIFd-HAZwFy-Eg865RX7jd36WBqEAbSxzEvhdlMBk50qAGfIdPMKJYcy0D20qV4ni7TbNm9pZP-saQvDCEB5j8D95Jw-FQa8gTcuV7ZQEwH1NwfnwK9IgtY54linoW0ZDNOcv9LYuyqlyVKEhHJOdXQkb7VD7482PshPL-M-RULcHA2b-KAmWfU08j2M4thw7yDxMoQG2antVzwdqMw93H-rghr-ZH7BM4yaq7hFw__&amp;Key-Pair-Id=AFKALOHF5GGSLRBV4ZA">https://dl.wqixs1.xdc7.cloudfront.net/105180256/626654brc.pdf?1692636739--&amp;response-content-disposition=inline%3B+filename%3DInterspecies_Interaction_between_Pseudom.pdf&amp;Expires=1725965680&amp;Signature=MAD0AZ1i42Cg-SA9YKg5XhEu0EgTAP1OAMzguOeA1UAe9e2Y-GBvdNJS0SHGiiPLjFMHVpN0eiSZRkgrj3-K2ZadpvfPNDy-iGIFd-HAZwFy-Eg865RX7jd36WBqEAbSxzEvhdlMBk50qAGfIdPMKJYcy0D20qV4ni7TbNm9pZP-saQvDCEB5j8D95Jw-FQa8gTcuV7ZQEwH1NwfnwK9IgtY54linoW0ZDNOcv9LYuyqlyVKEhHJOdXQkb7VD7482PshPL-M-RULcHA2b-KAmWfU08j2M4thw7yDxMoQG2antVzwdqMw93H-rghr-ZH7BM4yaq7hFw__&amp;Key-Pair-Id=AFKALOHF5GGSLRBV4ZA</a> |

| 8 | Diabetic Foot Ulcer Infections and <i>Pseudomonas aeruginosa</i> Biofilm Production During the COVID-19 Pandemic. | Microbiology | <p>During the different waves of the coronavirus (COVID-19) pandemic, there has been an increased incidence of diabetes mellitus and diabetic foot infections. Among gram-negative bacteria, <i>Pseudomonas aeruginosa</i> is the predominant causative agent for diabetic foot ulcer infections in low-resource countries. <i>P. aeruginosa</i> possesses a variety of virulence factors, including biofilm formation. Biofilm formation is an important benchmark characteristic in the pathophysiology of diabetic foot ulceration. The main objective of the current study was to identify the most commonly isolated organisms and their antibiotic susceptibility</p> | 2022 | <a href="https://microbiologyjournal.org/diabetic-foot-ulcer-infections-and-pseudomonas-aeruginosa-biofilm-production-during-the-covid-19-pandemic/">https://microbiologyjournal.org/diabetic-foot-ulcer-infections-and-pseudomonas-aeruginosa-biofilm-production-during-the-covid-19-pandemic/</a> |

patterns in diabetic foot patients during the COVID-19 pandemic. We also determined the genes associated with bacterial persistence and biofilm formation in the predominantly isolated organism. Accordingly, 100 wound swab samples were collected from diabetic foot patients from different hospitals in Alexandria, Egypt. Through phenotypic detection of biofilm formation, 93% (40) of the 43 P. aeruginosa isolates examined were categorized as biofilm producers. Molecular detection of the biofilm-encoding genes among the 43 P. aeruginosa isolates was as follows: algD (100%), pelF (88%) and pslD (49.7%), and this highlights a need for biofilm formation inhibitors to prevent the

| 9 | <p>Anti-spike and neutralizing antibodies after two doses of COVID-19 sinopharm/BIBP vaccine</p> | Microbiology | <p>Host response to COVID-19 vaccines is partially evaluated through the estimation of antibody response, specifically the binding anti-spike (anti-S) and the neutralizing antibodies (nAbs) against SARS-CoV-2. Vaccine-induced humoral response affects decisions on the choice of vaccine type, vaccine acceptance, and the need for boosting. Identification of risk factors for poor antibody response helps to stratify individuals who might potentially require booster doses.</p> | 2022 | <p><a href="https://www.mdpi.com/2076-393X/10/8/1340">https://www.mdpi.com/2076-393X/10/8/1340</a></p> |

The primary objective of this cross-sectional study was to investigate the antibody response after receiving two Sinopharm vaccine doses. Factors affecting antibody response were additionally studied. Moreover, a predictive cutoff for anti-S was generated to predict positivity of nAbs. Blood samples were collected from 92 adults and relevant data were recorded. Antibody levels (anti-S and nAbs) against SARS-CoV-2 were tested one month following the second dose of Sinopharm vaccine using two commercial ELISA tests. Among the 92 participants, 88 tested positive for anti-S (95.7%), with a median level of 52.15 RU/mL (equivalent to 166.88 BAU/mL). Fewer

| 12 | A Nanoparticles based Microbiological Study on the Effect of Rosemary and Ginger Essential Oils against <i>Klebsiella pneumoniae</i> . | Microbiology | <p><b>Background:</b><br/><i>Klebsiella pneumoniae</i> is a nosocomial pathogen in outbreaks of hospital infections. It is one of the major factors for morbidity and mortality in hospitalized patients especially those infected with colistin-resistant pathogens. Many plant essential oils have antimicrobial activities and have been investigated as natural sources to combat multiple antibiotic resistances. Moreover, recent advances in phytonanotechnology have created exciting opportunities for the management of many infections.</p> <p><b>Objective:</b><br/>This study aims at investigating the antimicrobial and antibiofilm effect of</p> | 2020 | <a href="https://benthamopen.com/ABSTRACT/TOMICROJ-14-205">https://benthamopen.com/ABSTRACT/TOMICROJ-14-205</a> |

rosemary and ginger essential oil-based nano-sized formulations on colistin resistant *K. pneumonia* clinical isolates.

**Methods:**

Isolation and identification of 30 *K. pneumonia* isolates from different human samples were done followed by antibiotic susceptibility testing and detection of biofilm gene (*mrkD*). Examination of the activity of the tested essential oils and their chitosan nanoparticle formulations against the selected isolates was made by determination of their MICs using broth microdilution method followed by biofilm inhibition test and quantitative real-time PCR for the expression of *mrkD* gene in the presence of the oils and nanoparticles formulations compared to untreated bacterial isolates.

**Results:**

Our results showed that the minimum inhibitory concentration of rosemary and ginger oils was 1250 µg/ml, that of

|    |   |              | <p>showed the highest inhibitory activity with IC<sub>50</sub> values of 1.89, 2.73, and 2.14 μM, respectively, comparable to novobiocin (IC<sub>50</sub>, 1.636 μM). Compounds <b>2a–c</b>, <b>3a</b>, <b>7c</b>, <b>9c,d</b>, and <b>10a,b</b> revealed half the potency of levofloxacin in inhibiting the growth of <i>Pseudomonas aeruginosa</i>. As an attempt to rationalize the observed antibacterial activity for the most active compounds <b>8b</b>, <b>9c</b>, and <b>9d</b>, molecular docking in the ATP binding site of <i>S. aureus</i> gyrase B was performed using Glide. Such compounds could be considered as promising scaffolds for the development of new potent antibacterial agents.</p> |      |   |
| 15 | Design, synthesis, antibacterial evaluation and molecular docking studies of some new quinoxaline derivatives targeting dihydropteroate synthase enzyme | Microbiology | <p>Development of new antimicrobial agents is a good solution to overcome drug-resistance problems. From this perspective, new <a href="#">quinoxaline derivatives</a> bearing various bioactive <a href="#">heterocyclic moieties</a> (thiadiazoles, <a href="#">oxadiazoles</a>, <a href="#">pyrazoles</a> and thiazoles) were designed and synthesized. The newly</p>  | 2018 | <a href="https://www.sciencedirect.com/science/article/abs/pii/S0045206817307423">https://www.sciencedirect.com/science/article/abs/pii/S0045206817307423</a> |

|----|--|--------------|--|------|---|
|    |  |              | <p>synthesized compounds were evaluated for their <i>in vitro</i> <a href="#">antibacterial activity</a> against nine bacterial human pathogenic strains using the <a href="#">disc diffusion</a> assay. In general, most of the synthesized compounds exhibited good antibacterial activities. The thiazolyl <a href="#">11c</a> displayed significant antibacterial activities against <i>P. aeruginosa</i> (MIC, 12.5 µg/mL vs <a href="#">levofloxacin</a> 12.5 µg/mL). <a href="#">Molecular docking</a> studies indicated that the synthesized compounds could occupy both <i>p</i>-amino <a href="#">benzoic acid</a> (PABA) and <a href="#">pterin</a> binding pockets of the <a href="#">dihydropteroate synthase</a> (DHPS), suggesting that the target compounds could act by the inhibition of bacterial DHPS enzyme. The results provide important information for the future design of more potent <a href="#">antibacterial agents</a>.</p> |      |   |
| 16 | Synthesis of pyrazolo-1,2,4-triazolo[4,3-a]quinoxalines as | Microbiology | <b>Aim:</b> The development of a new class of antimicrobial agents is the optimal lifeline to scrap the  | 2018 | <a href="https://www.future-science.com/doi/full/10.4155/fmc-2018-0082">https://www.future-science.com/doi/full/10.4155/fmc-2018-0082</a> |

|  | <p>antimicrobial agents with potential inhibition of DHPS enzyme</p> |  | <p>escalating jeopardy of drug resistance. <b>Experimental:</b> This study aims to design and synthesize a series of pyrazolo-1,2,4-triazolo[4,3-<i>a</i>]quinoxalines, to develop agents having antimicrobial activity through potential inhibition of dihydropteroate synthase enzyme. The target compounds have been evaluated for their <i>in-vitro</i> antimicrobial activity.</p> <p><b>Results &amp; discussion:</b> Compounds <b>5b</b>, <b>5c</b> were equipotent (minimal inhibitory concentration = 12.5 µg/ml) to ampicillin. The docking patterns of <b>5b</b> and <b>5c</b> demonstrated that both fit into <i>Bacillus Anthracis</i> dihydropteroate synthase pterin and <i>p</i>-amino benzoic acid-binding pockets.</p> <p>Moreover, their physicochemical properties and pharmacokinetic profiles recommend that they can be considered drug-like candidates. The results highlight some significant information for the future design of lead compounds as antimicrobial agents.</p> |  |  |

| 17 | Efficacy of the Clove Oil, Cinnamon Oil, Thyme Oil and Origanum Oil against Multidrug Resistant <i>Pseudomonas aeruginosa</i> and <i>Burkholderia cepacia</i> Complex | Microbiology | <p>The increased frequency in clinically observed cases of antibiotic resistance has been attributed to many factors such as the misuse and overuse of antibiotics since in some countries, antibiotics are sold over the counter without a prescription, the large quantities of antibiotic waste produced from livestock rearing, overconfidence in human control over infectious diseases and the continued decline in the number of newly approved antibiotics. Few studies have focused on the investigation of antimicrobial activities of medicinal plants against clinically isolated antibiotic resistant pathogens. Hence the aim of this work is to investigate the antimicrobial effect of clove, cinnamon, thyme and origanum on clinically isolated multidrug resistant strains of <i>Pseudomonas aeruginosa</i> and <i>Burkholderia cepacia</i> complex.</p> | 2017 | <p><a href="https://www.ijcmas.com/abstractview.php?ID=1270&amp;vol=6-1-2017&amp;SNo=4">https://www.ijcmas.com/abstractview.php?ID=1270&amp;vol=6-1-2017&amp;SNo=4</a></p> |
