1	ITSR-HISL: An Improved Model for Trajectory Signature Recognition in Human Interactive Sign Language	Computer and Information Technology	Trajectory tracking is used to keep tracks objects. Trajectory tracking control is used to affect desired trajectories of a device, human and anything can move. In order to precisely track specified trajectories, or be able to follow more general trajectories, many tracking control algorithms have been suggested, but still there is some problems of tracking trajectory in its application. This paper introduces a	2015	https://ieeexplore.ieee.org/abstract/document/7363178

necessary to understand these individuals' gestures and linguistic semantics. The main objective of this work is to establish a new model that enhances the performance of the existing paradigms used for sign language recognition. This study developed three improved deeplearning models based on YOLOv5x and attention methods for recognizing the alphabetic and numeric information hand gestures convey. These models were evaluated using the MU HandImages ASL
